

Botswana

General statement: The Botswana is a type of cattle known all over Africa.

Classification: They are mostly found in Southern Africa.

The Botswana is part of the Sanga breed which means bull.

Description: The Botswana is a large animal with long horns and they are really tough in fights.

Diet: The Botswana eats what normal cattle would eat like grass, sometimes prickles and sometimes plants.

Habitat: Botswana's Habitat is Southern Africa's outback such as the African plains, grass and trees.

Breeding: Botswana cattle were first made, when in 700AD Tswana cattle were brought to Southern Africa and bred with the Sanga cattle. Botswana cattle are the same as any other cattle with a breeding season. Once the cow is pregnant, six months later the calve will be born. The cow/bull will live up to 25 years or older. Once it is breeding season again the cycle starts all over again.

Predators: Botswana cattle have some predators such as Cheetah, Hyena, Lion, and leopard.
